

TS-RAG TIME: evidence status

1 Obtained evidence

No cluster results have been obtained or analyzed for this independent project. No accuracy, dispersion or latency benefit is claimed for TS-RAG or the validation mixture. Local synthetic verification checks implementation contracts only and is not forecasting evidence.

2 Scope and limits

The implemented comparison has four frozen Chronos controls, native TS-RAG with a 512-point Chronos-Bolt fallback, and a validation-weighted mixture with maximum-context Chronos-2. Its growing causal datastore admits every eligible historical date by default. These choices differ from Adapttime's historical datastore and fallback protocol; no historical result is imported as evidence.

3 Next evidence needed

Run the short-task remote smoke before the full 90-task comparison. Inspect grid agreement, fallback counts and reasons, validation support and frozen weights. Analyze the complete matched metric means, population variance/std and timing components before supporting a model or method decision. The no-validation mixture is explicitly Chronos-2 and provides no evidence of validation weighting.
